- The equation being linear and we find that summation of two dependent/independent solutions is also a solution.
- If nearby frequency waves, with same phase and amplitude, superposes Beats are produced. Here the amplitude is modulated. The modulation frequency is equal to the difference in frequencies of the two waves.
- If waves with same frequency and amplitude and a constant phase difference superposes Interference pattern is produced. Here too the amplitude is modulated but the amount of modulation is position dependent. The energy is thus redistributed in space.

LINEARITY OF EOM \Rightarrow *Superposition*

Phase Difference
 \Rightarrow *Interference*

- The equation of motion is said to be linear if the differentials have constant coefficient only. Therefore,

$$\alpha\ddot{y} + \beta y = 0 \quad (1)$$

is a *Second Order Linear* differential equation.

- If y_1 and y_2 are two different solutions then

$$\alpha\ddot{y}_1 + \beta y_1 = 0$$

$$\alpha\ddot{y}_2 + \beta y_2 = 0$$

$$\Rightarrow \alpha(\ddot{y}_1 + \ddot{y}_2) + \beta(y_1 + y_2) = 0$$

$$\Rightarrow \alpha \frac{d^2(y_1 + y_2)}{dt^2} + \beta(y_1 + y_2) = 0$$

$y_1 + y_2$ is also a solution.

$$y = 2a \cos \frac{(\phi_1 - \phi_2)}{2} \sin \left(\omega_1 t + \frac{(\phi_1 + \phi_2)}{2} \right) \quad (12)$$

- Thus, the Intensity

$$\begin{aligned} I &= \langle y^2 \rangle = 4a^2 \cos^2 \frac{(\phi_1 - \phi_2)}{2} \left\langle \sin^2 \left(\omega_1 t + \frac{(\phi_1 + \phi_2)}{2} \right) \right\rangle \\ &= 4a^2 \cos^2 \frac{(\phi_1 - \phi_2)}{2} \times \frac{1}{2} \\ &= I_0 \cos^2 \frac{(\phi_1 - \phi_2)}{2} \end{aligned}$$

because, for random phases, the average of \sin^2 and \cos^2 is positive and equals the value $1/2$.

- The intensity is maximum when the phase difference takes the value $\pm n\pi$ where $n = 0, 1, 2, \dots$
- *The Intensity at a given position therefore depends on the Phase Difference between the two superposing waves at that position.*
